Balanced vertex decomposable simplicial complexes and their h-vectors

Given any finite simplicial complex $\Delta$, I will discuss how to construct a new simplicial complex $\Delta_\chi$ that is balanced and vertex decomposable and whose $h$-vector is the $f$-vector of the original complex. This construction generalizes the "whiskering" construction of Villarreal, and Cook and Nagel. I will also discuss how to reverse this process in the special case of the independence complex of a chordal graph.
