*Tau Signatures and Characters of Weyl Groups*

Let $G_R$ be the real points of a complex linear reductive group and $\hat{G}_\lambda$ its classes of irreducible admissible representations with infinitesimal integral regular character $\lambda$. In this case each cell of representations is associated to a special nilpotent orbit. This helps organize the corresponding set of irreducible Haris-Chandra modules. I will describe algorithms for identifying the special nilpotent orbit attached to a cell in terms of descent sets appearing in the cell. This is joint work with Thomas Folz-Donahue, Steven Glenn Jackson, and Todor Milev.
